Assignment 4

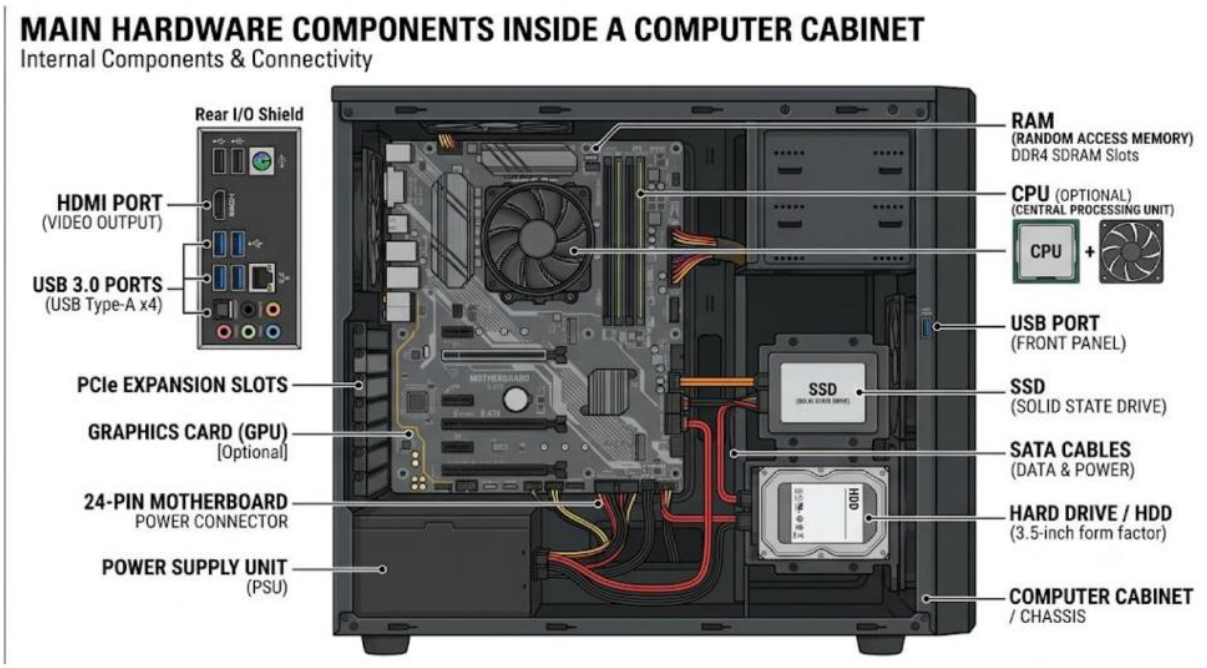

1.Open your computer or laptop and take a clear photo or screenshot of the System Information or About page that shows your processor (CPU), RAM, and storage details.

Ans-

2.Draw and label a diagram (on paper or digitally) showing the main hardware components inside a computer cabinet, including CPU, RAM, motherboard, hard drive/SSD, power supply, and at least two ports (USB, HDMI, etc.).

Ans-

**3.List the hardware components you would check or upgrade to make your laptop run faster for gaming or video editing, and explain in one line why each upgrade helps.

Hint: Think about RAM, SSD, GPU, and cooling.**

Ans-

Component	Upgrade	Why it helps
RAM	8 GB → 16 GB or more	Helps run games, editing software and multiple applications smoothly.
SSD	HDD → NVMe/SATA SSD	Provides faster booting, application loading and file access.
GPU	Better dedicated GPU	Improves gaming FPS and video-rendering performance.
Cooling	Clean fan / improve cooling	Prevents overheating and reduces performance throttling.

4.Research the difference between SSD and HDD storage, then write a short comparison (3 points) explaining which one is better for a student who wants fast boot times and why.

Ans-

Feature	SSD	HDD
1. Speed	Much faster; gives quick boot and application loading	Slower because it uses mechanical moving parts
2. Durability	More resistant to physical shock because it has no moving parts	More sensitive to physical shocks because it has moving parts
3. Price	Usually more expensive per GB	Usually cheaper per GB

- Which is better for a student who wants fast boot times?

SSD is better. An SSD can significantly reduce Windows boot time and make applications open faster. For a student using Windows, browsers, MS Office, programming tools and normal applications, an SSD is generally the better choice for performance.
